# Introduction

- ↪ The Wind Force is imposing the deflection of a Turbine Rotor Blade
- ↪ Main stiffness and therefore deflection drivers are the spar caps
- ↪ Biaxial laminates follow the deformation imposed from the spar caps
- ↪ For Biaxial laminates the blade deflection imposes a displacement controlled movement

**ISMEM 2017**

- 2nd International Symposium on Multiscale  
Experimental Mechanics: Multiscale Fatigue

# Introduction

- ↪ The Biax laminates develop cracks during full scale fatigue test
- ↪ When are the crack starting?
- ↪ What are they causing?
- ↪ Fatigue test campaign of Biax laminate
- ↪ Displacement control
- ↪ Test termination condition 23% loss of stiffness
- ↪ Correlation of crack formation with loss stiffness

# Materials & manufacturing

- ↪ Glass/Epoxy
  - ↪ Saertex UD 1200 gr/m<sup>2</sup>
  - ↪ Airstone 880E/Airstone 886H (100:31 mass ratio)
- ↪ Matrix degased for 10 mins under vaccum
- ↪ VARTM (infusion temp. 45°C)
- ↪ Cross-ply stacking sequence
- ↪ Coupons cut [ $\pm 45$ ]<sub>2s</sub>
- ↪ Curing: 45°C for 20 hours
- ↪ Post-curing: 60°C for 10 hours
- ↪ FVF 53%

# Experimental setup

- ↪ Fatigue test
  - ↪ Tension-tension  $R=0.1$
  - ↪ Three max. displ. levels
  - ↪ Frequency sweep from 0,5Hz up to test frequency
  - ↪ Test frequency depending on the displacement level
  - ↪ 25kN coupon machine
  - ↪ Displacement controlled (LVDT)
  - ↪ Room temperature
  - ↪ Test end @ 23% LFS
- ↪ Periodic automatic photos at 70% of test max. displacement

- ↪ Coupon Geometry
  - ↪ Length 27mm (avoid fiber bridging between grips)
  - ↪ Width 25mm (prevent buckling)

# Analysis

↪ Stiffness degradation during fatigue

↪ Stiffness(Cyc.)

$$\frac{\text{Force}_{\max} - \text{Force}_{\min}}{\text{Displ}_{\max} - \text{Displ}_{\min}}$$

↪ Crack density

$$\rho_w = \frac{\sum_{i=1}^n c_i}{w \cdot L}$$

↪  $c_i$  crack length

↪  $W$  coupon width

↪  $L$  coupon length

# Image Analysis

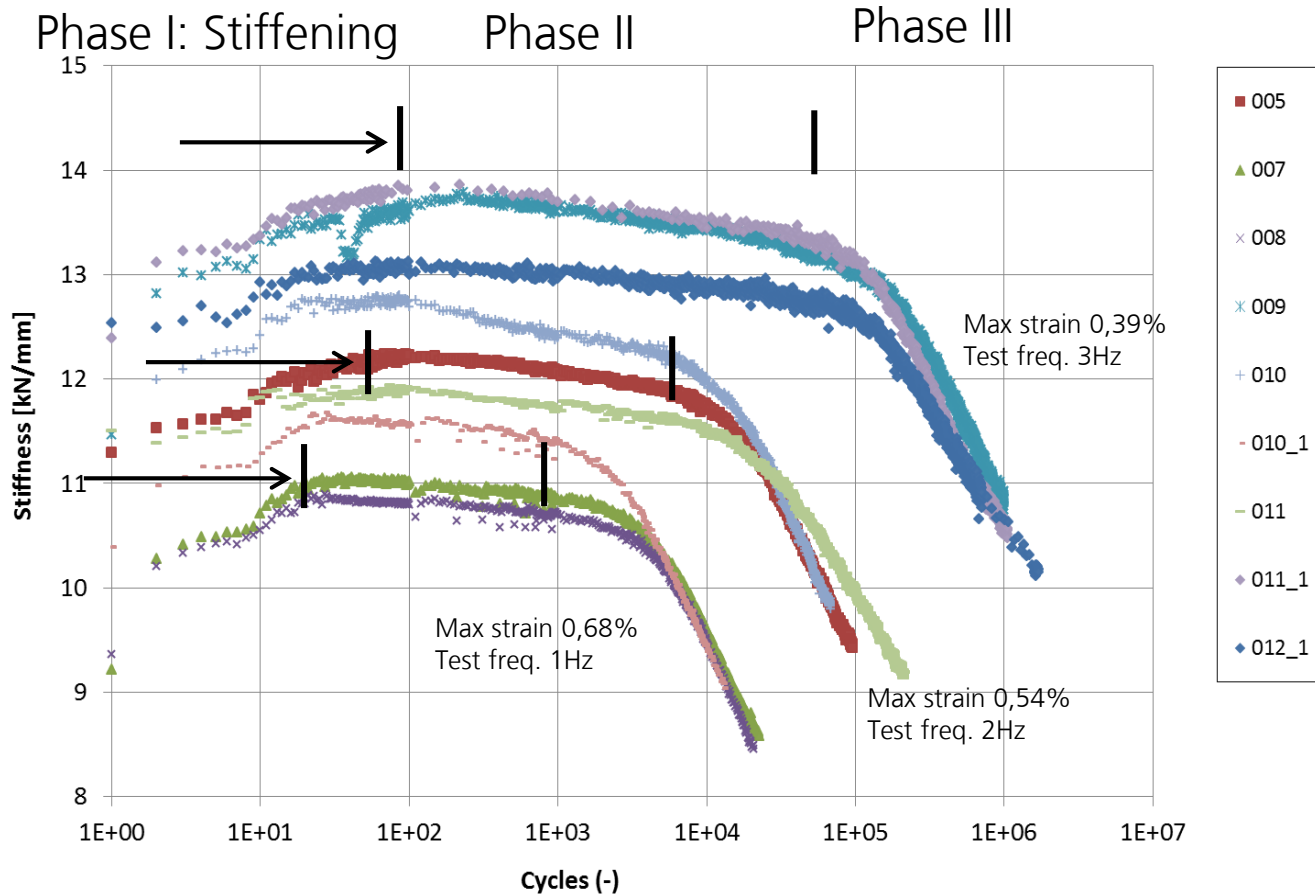

- ↪ Image analysis tool
  - ↪ Based on open CV Library
  - ↪ Adaptive thresholding method with Gaussian weighting
  - ↪ Automatic identification of cracks (subtraction of running photo from reference photo)
  - ↪ Automatic calculation of the crack density

# Loss of Fatigue Stiffness (LFS)

↪ Stiffness degradation during fatigue (cycle: logarithmic scale)

# Loss of Fatigue Stiffness (LFS)

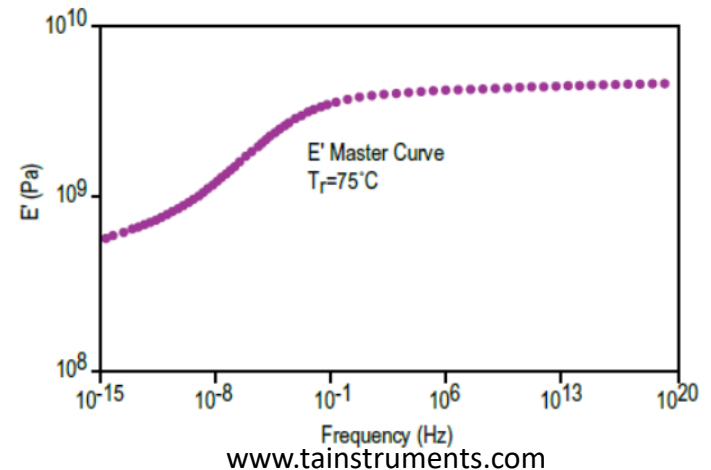

↪ Stiffness degradation during fatigue

Phase	Start cycle	End cycle	Description	Effect
I	0	10-200 (depending on the freq.sweep)	Stiffening	Viscoelastic effect of the resin

↪ Fatigue test frequency sweep characteristics

No of Coupons	Frequency	Sweep rate	Sweep duration
[ - ]	[ Hz ]	[ Hz/sec ]	[ Cycles ]
3	1	0,025	36
3	2	0,025	76
2	3	0,025	116
1	5	0,025	196

↪ Resin viscoelastic performance

# Loss of Fatigue Stiffness (LFS)

← Stiffness degradation during fatigue

Phase	Start cycle	End cycle	Description	Effect
II	10-200 cycles	≈5% of fatigue life	Moderate stiffness degradation ≈3,3%	Microcracking (not visible)

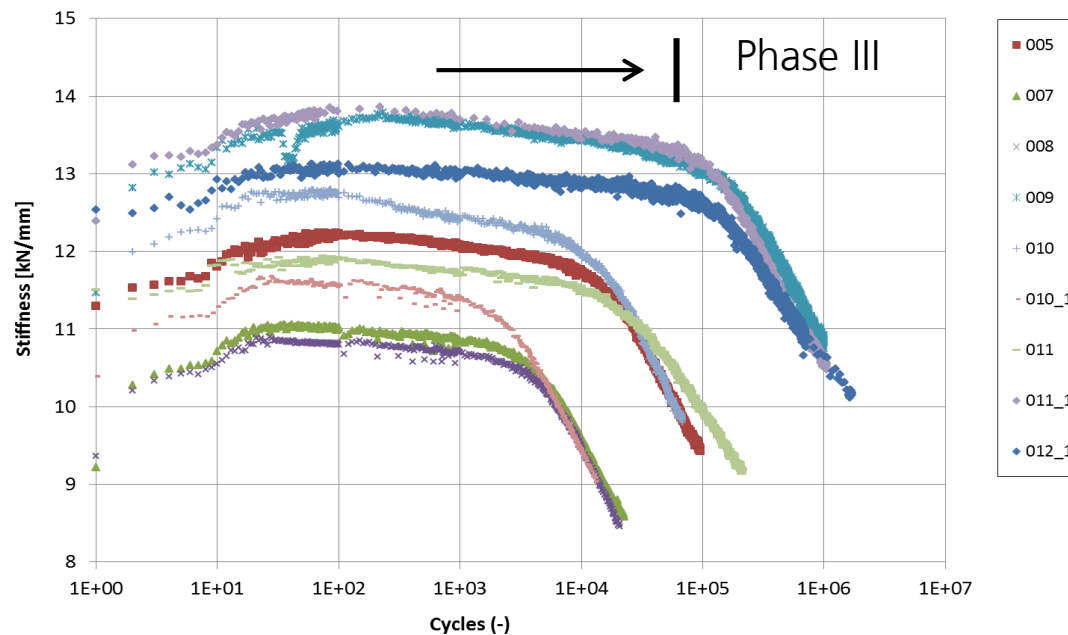

ISMEM 2017

- 2nd International Symposium on Multiscale  
Experimental Mechanics: Multiscale Fatigue

# Loss of Fatigue Stiffness (LFS)

← Stiffness degradation during fatigue

Phase	Start cycle	End cycle	Description	Effect
III	After first visual crack	23% of Stiffness Loss	Major stiffness degradation	Macroscopically visible cracks

# Loss of Fatigue Stiffness (LFS)

↪ Stiffness degradation during fatigue (both normalized to unity)

- ↪ Stiffness degradation is correlated to the fatigue life ratio
- ↪ When stiffness degradation is known then the fatigue life ratio could be calculated
- ↪ All tests show similar performance

# Loss of Fatigue Stiffness (LFS)

↪ Relative stiffness degradation & crack density during fatigue

- ↪ Calculation of relative loss of stiffness only in phase III
- ↪ Linear relation between relative loss of stiffness and crack density

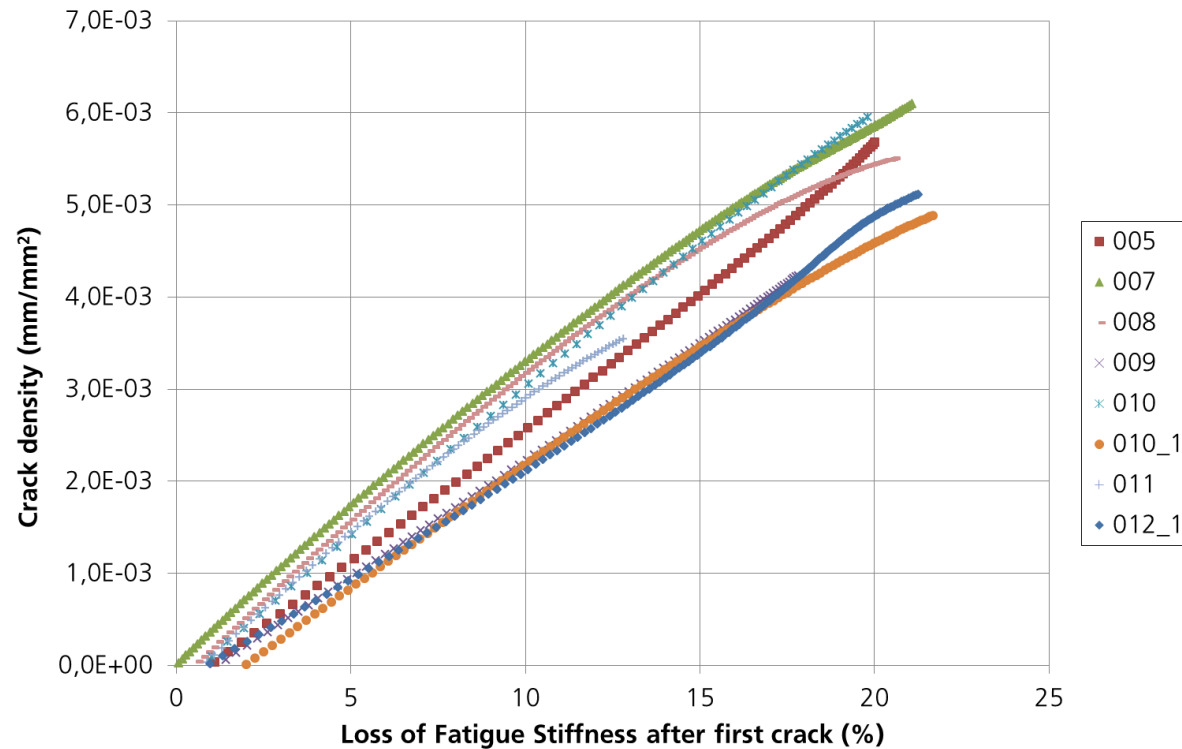

# Loss of Fatigue Stiffness (LFS)

↪ Relative stiffness degradation during fatigue and crack density

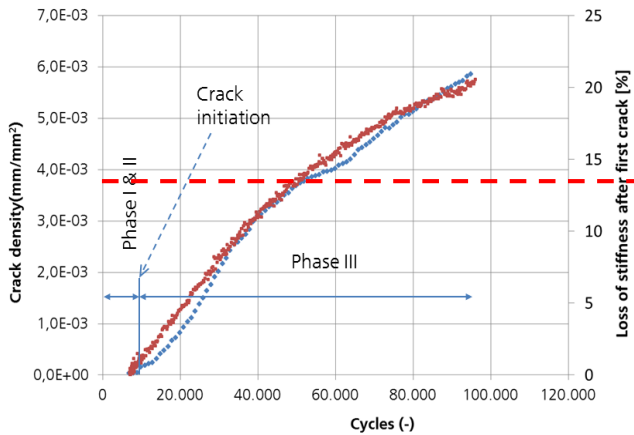

↪ Calculation of relative loss of stiffness only in phase II

↪ Linear relation between relative loss of stiffness and crack density

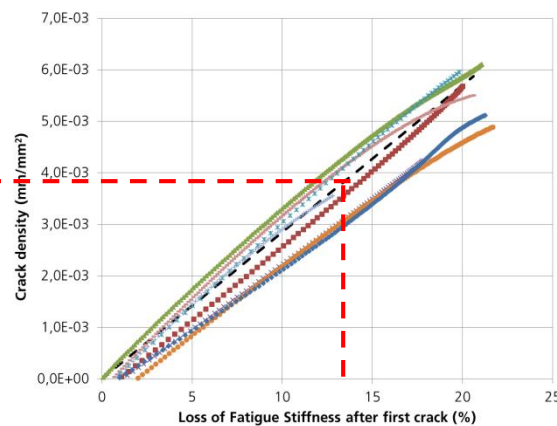

# Loss of Fatigue Stiffness (LFS): Case Study

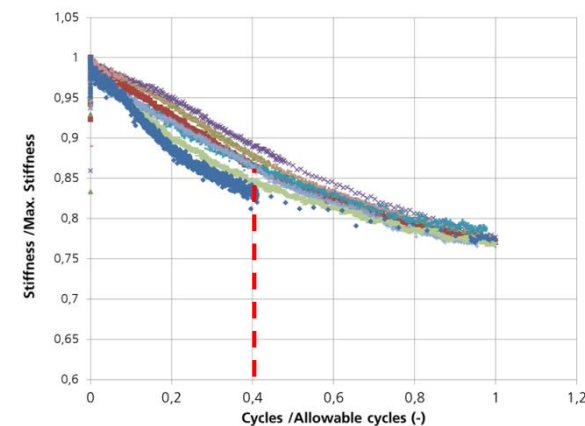

Loss of stiffness only after crack initiation

Linear relation between crack density & LFS

Unique formulation for the description of normalized fatigue cycle (NFC) number vs. norm. LFS after 1<sup>st</sup> crack

Given crack density  $3,82 \cdot 10^{-4}$

Stiffness Loss of 13,4%

Specific life cycle ratio 49,6%

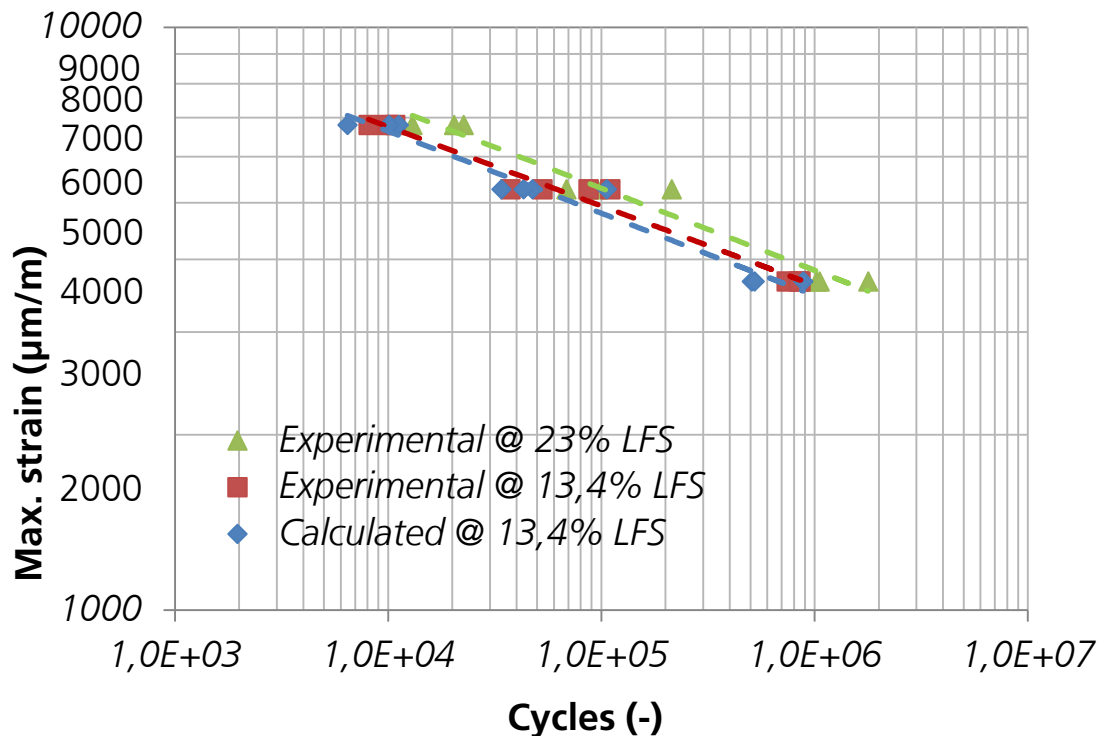

# Loss of Fatigue Stiffness (LFS) : Case Study

↳ Loss of stiffness only after crack initiation

↳ Linear relation between crack density & LFS

↳ Unique formulation for the description of normalized fatigue cycle (NFC) number vs. norm. LFS after 1<sup>st</sup> crack

↳ Material fatigue performance @ 13,4% LFS

$$49,6\% \cdot e/N @ 23\%$$

↳ Remaining life can be calculated

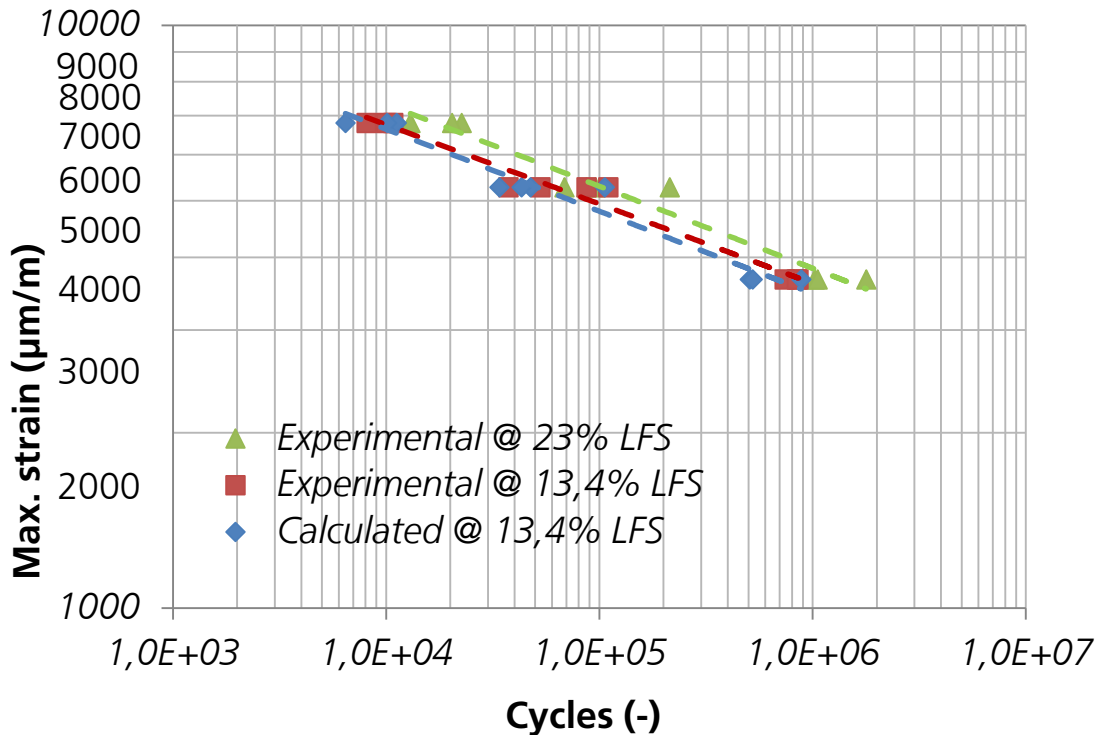

# Loss of Fatigue Stiffness (LFS) : Case Study

↳ Loss of stiffness only after crack initiation

↳ Linear relation between crack density & LFS

↳ Unique formulation for the description of normalized fatigue cycle (NFC) number vs. norm. LFS after 1<sup>st</sup> crack

↳  $e/N$  parameters =  $f(\text{crack density})$

$$e = A \cdot N^b$$

LFS	A	b
23% (exp.)	26790	-0,141
13,4% (exp.)	23678	-0,136
13,4% (calc.)	24268	-0,141

13,4% (exp.)	23678	-0,136
13,4% (calc.)	24268	-0,141

# Summary

- ↪ The damage evolution of a Biax  $[\pm 45]_{2s}$  laminate configuration was investigated during displacement controlled fatigue test ( $R=0.1$ )
- ↪ Matrix cracking parallel to the fibers direction was tracked with high resolution photos
- ↪ For the derivation of the developed crack density, automatic image processing was performed with an in-house developed tool
- ↪ It was evident that the developed cracks (macroscopically visible) are responsible for the stiffness degradation along the load axis
- ↪ Before the development and recognition of the macroscopic visible cracks, all coupons showed an average stiffness reduction of around 3%. This was attributed to microcracks
- ↪ The Fatigue Stiffness degradation form was similar for all specimens when plotted over fatigue cycles in a normalized to unity scale
- ↪ The experimentally measured crack density correlates directly to the the run cycle number ratio

# Summary

- ← Provided a characterized  $e/N$  curve, remaining life of a coupon can be calculated with limited uncertainty
